Biosecurity in aquaculture consists of practices that minimize the risk of introducing an infectious disease and spreading it to the animals at a facility and the risk that diseased animals or infectious agents will leave a facility and spread to other sites and to other susceptible species. ... The principles of quarantine apply for new fish ...

### **Biosecurity in Aquaculture, Part 1: An Overview | The Fish ...**

The frequency with which feed is distributed is primarily determined by fish size and the characteristics of the culture system. Young fish grow faster and have better feed efficiency when fed several times a day. Older fish do not exhibit the same benefits from frequent feeding. Feeding can be done by hand or with automatic feeders.

### **Principles of Fish Nutrition | The Fish Site**

In this case the fish stocked should be 13-15 cm fingerlings produced in fish farms ('aquaculture-based fisheries') in order to avoid the losses that would occur with smaller fish. Common carp are usually stocked with other cyprinid species, in accordance with the productivity of the water and the intensity of exploitation.

We aim to expand the availability of seafood from Best Aquaculture Practices-certified facilities that address these principles. 1 Shall coordinate and collaborate with national, regional and local governments in the development and implementation of policies, regulations and procedures necessary and practicable to achieve environmental, economic and social sustainability of aquaculture operations.

## **Guiding Principles « Global Aquaculture Alliance**

One of the biggest impacts of aquaculture is its environmental impacts. Some aquaculture practices that do not maintain standards and follow sustainable aquaculture practices, negatively impact the environment and also put pressure on wild fish growth by habitat modification and using wild caught fish as fish feed.
