Oil Field Pumpers Guide

Okay so, there are just some things in the oilfield that are known by all of us, but that we really don't talk about. One of those things is the silent rule that after a workover rig has been up on one of your wells, you step carefully around your equipment and stock tanks. New pumpers have discovered this sometimes in a traumatizing way when, in a moment where they really need a rag and ...

For most people, the most visible feature of the search for petroleum is the oil field pumps, or pumpjacks -- the bobbing metal constructs that dot the surface in areas where petroleum is produced. Because of their characteristic shape and motion, pumpjacks, also called beam pumps, are often given fanciful names such as "lonely birds" and "nodding donkeys."

How Do Oil Field Pumps Work? | Sciencing

The Lease Pumper's primary job responsibility: To safely produce, treat, and sell as much crude oil and natural gas as possible at the lowest cost. SOER Lease Pumper's Handbook The first priority of a Lease Operator is to work in a manner safe to you and those around you while complying with all applicable regulations.

Lease Pumper Training - New Mexico Junior College

A pumpjack is the overground drive for a reciprocating piston pump in an oil well. It is used to mechanically lift liquid out of the well if not enough bottom hole pressure exists for the liquid to flow all the way to the surface. The arrangement is commonly used for onshore wells producing little oil. Pumpjacks are common in oil-rich areas.

Pumpjack - Wikipedia

Pumpers work on oilfields and are in charge with operating power pump equipment used to pump oil. Duties listed on a Pumper example resume are setting the rate of pumping, following production schedules, operating valves and compressors to separate natural gas, handling pump maintenance and repairs, and assembling pipes.

Pumper Resume Examples | JobHero

The pumper starts the compressor engine and opens valves to return compressed gas to the bottom of the well. The pump depressurizes the pipe and forces oil to rise to the surface. The wellhead pumper then must monitor the flow as the product travels to make sure it is moving at the proper rate.
