All models are wrong, but some are useful. —George E. P. Box Model-Based Systems Engineering MBSE is the application of modeling systems as a cost-effective way to explore and document system characteristics. By testing and validating system characteristics early, models facilitate timely learning of properties and behaviors, enabling fast feedback on requirements and design decisions. MBSE ...

In that model, Tinto (1993) argued for research about community- and structural-based strategies for supporting doctoral student persistence. He conceptualized the stages of doctoral education as transition, candidacy, and completion. Gardner (2009 b) followed a similar model, using the labels of entry, integration, and candidacy.

Computerized adaptive testing (CAT) is a form of computer-based test that adapts to the examinee's ability level. For this reason, it has also been called tailored testing. In other words, it is a form of computer-administered test in which the next item or set of items selected to be administered depends on the correctness of the test taker's responses to the most recent items administered.

In this paper, new contributions to requirements-based testing with deterministic finite state machines are presented. Elementary requirements are specified as triples consisting of a state in the reference model, an input, and the expected reaction of the system under test defined by a set of admissible outputs, allowing for different implementation variants. Composite requirements are ...

In software engineering, a test case is a specification of the inputs, execution conditions, testing procedure, and expected results that define a single test to be executed to achieve a particular software testing objective, such as to exercise a particular program path or to verify compliance with a specific requirement. Test cases underlie testing that is methodical rather than haphazard.
