Step 1: Identify the Problem. The first step in the process is to identify a problem or develop a research question. The research problem may be something the agency identifies as a problem, some knowledge or information that is needed by the agency, or the desire to identify a recreation trend nationally.

Most classically trained chemists can adapt to the more commercially oriented world of process research and development. Process chemistry involves optimizing a large number of variables at the same time (i.e., balance purity, reproducibility, number of operations, cost per kilogram, etc.). Process chemists never find “the” right answer, but they continually tweak the manufacturing process as variables (such as prices and availability of raw materials) change.

Psychologists should also be cognizant of situations where they have access to confidential ideas or research, such as reviewing journal manuscripts or research grants, or hearing new ideas during a presentation or informal conversation.

Five principles for research ethics

Principles of research ethics. There are a number of ethical principles that should be taken into account when performing undergraduate and master's level dissertation research. At the core, these ethical principles stress the need to (a) do good (known as beneficence) and (b) do no harm (known as non-maleficence). In practice, these ethical principles mean that as a researcher, you need to: (a ...

Ten Principles of the Wraparound Process

Potential participants should make their own decision about whether they want to participate or continue participating in research. This is done through a process of informed consent in which individuals (1) are accurately informed of the purpose, methods, risks, benefits, and alternatives to the research, (2) understand this information and how it relates to their own clinical situation or interests, and (3) make a voluntary decision about whether to participate.
