One problem with a Turbo is the close proximity of the cold intake charge with the hot exhaust temperatures within the turbo. Don't forget that a big air intake heat rise comes from the actual compression of air so even supercharged engine will benefit from an intercooler. If you have ever felt the nozzle on a tyre pump you will realise that when air is compressed it gains heat.

Garrett performance intercoolers and intercooler cores work together with the turbocharger as part of the total induction system. When air is compressed in the turbocharger it gains a lot of heat. Hot air is less dense and therefore is not able to produce as much energy because less can be fed into the engines cylinders.

### Performance Intercoolers - Garrett Motion

There are two type of Intercoolers. 1. Air-to-Air Intercooler. The Air-to-Air intercooler e xtracts heat from the compressed air by passing it through its network of tubes with cooling fins. As the compressed air is pushed through the intercooler, heat is transfered through the tubes and, into the cooling fins.
